

Ariel Samin

Senior Software Engineer

Email: ariel.samin@gmail.com | Phone: 054-7535758 | LinkedIn: [Ariel Samin](#)

Professional Summary

Senior Software Engineer with 10+ years of expertise building scalable, distributed, high-performance server-side systems in C# (.NET). Experienced in large-scale data pipelines, multi-threaded architectures, microservices, and cloud-native development on Azure. Focused on reliability, observability, and clean component design for enterprise-grade systems.

Technical Skills

- **Languages & Frameworks:** C#, .NET 5/6, .NET Framework 4.x–4.8, SQL, Web API
 - **Data & Messaging:** MS SQL Server, RabbitMQ, Azure Blob & Table Storage, REST APIs
 - **Cloud & Infrastructure:** Azure DevOps (TFS), Azure Portal, ADX/Kusto
 - **Methodologies & Tools:** TDD, SOLID principles, IOC, Agile/Scrum, Git, Visual Studio, CI/CD Pipeline Development
-

Professional Experience

Nov 2024 – Present | Career Break

- Took a planned sabbatical to independently study financial markets, algorithmic trading systems, and data patterns, while spending dedicated time with family.
- Used GitHub Copilot to build automation scripts in Python and PowerShell, develop custom Pine Script trading indicators, and build a multi-service integration assistant using n8n — gaining hands-on experience with AI-assisted development workflows.
- Actively seeking a return to full-time, professional backend software development roles.

May 2019 – Nov 2024 | Varonis — Senior C# Backend Developer

- Transformed on-prem monolithic products into cloud-native SaaS, decomposing services into a microservices architecture and migrating embedded DB logic to C# application-layer code.
- Led the low-level design (LLD) and delivery of distributed, multi-threaded, and event-driven backend solutions utilizing C# (.NET), RabbitMQ, and Azure Blob Storage, with robust error handling, metrics, logging, and crash recovery.
- Optimized high-scale data pipelines capable of processing up to 100TB per transaction with constant memory usage and predictable throughput, ensuring maximum system reliability and uptime.
- Developed robust server-side features for enterprise-level Windows permissions administration and automation products.

- Conceived and developed a GUI tool to automate time-consuming, error-prone boilerplate operations in manual testing; started as a hackathon project, later productized internally.

Oct 2013 – Apr 2019 | NICE Systems — C# Backend Developer

- Provided critical tier-3 dev-support during the initial years, directly handling, diagnosing, and resolving complex technical bugs and production tickets from the field.
 - Developed core server-side features for the high-scale NICE Recording Platform.
 - Engineered high-availability, real-time event systems using Web API, WCF, and WebSockets, resulting in improved system stability and enhanced customer satisfaction.
 - Integrated external storage systems via REST APIs/SDKs and CTI/SIP telecom systems, expanding platform capabilities and supporting diverse customer environments.
 - Authored comprehensive technical API documentation, collaborating closely with technical writers to ensure clear usability for third-party integration partners.
-

Education

- **BSc in Computer Science** | Ben-Gurion University (Graduated 2013)
- Graduate Project: Built and deployed an anomaly detection system in databases utilizing Hidden Markov Models.
